

e-Builder COLLABORATOR

e-Builder Collaborator™ is a completely integrated document management and collaboration system for construction projects. Your team will be brought together in real-time to work more efficiently while the system documents the communication across all parties involved in your project. This enhanced process will significantly shorten the development cycle, reduce risk, and dramatically improve the efficiency of project execution. Collaborator allows you to automatically manage and track your teams' work, including the transfer of documents (uploads/downloads), email communications, and versioning. All affected team members are automatically notified of project updates so that time is not wasted working with outdated information.

With Collaborator, you can create electronically routed forms that follow your own business processes. This ensures that specific information is always communicated to the right parties on the project while maintaining a complete record of the communication. Additionally, Collaborator automatically generates electronic logs for these forms (e.g., RFIs, correspondence, and submittals). The log format is shared by

BENEFITS

1. Shorten development, design and construction cycle times
2. Organize and provide easy access to all documentation
3. Reduce the cost required to compile and distribute information
4. Manage multiple projects efficiently with exception-based reports
5. Identify cost and schedule issues earlier in the development process
6. Improve accountability by identifying task responsibility and status
7. Improve facility operations by providing easy access to historical information

every participant on the project – eliminating the time wasted by team members trying to decipher several unfamiliar log formats. Collaborator also allows you to have total visibility and keep track of ongoing tasks and schedules via a shared calendar. Here your teams can schedule meetings and events with multiple contacts from one shared location.

Facilitate Document Sharing, Markup, Transfer

With Collaborator, your project teams can easily and efficiently share, mark up, review, and archive complex drawings, specifications, and project information. With e-Builder Collaborator, over 250 file types are automatically converted into the Adobe PDF format so that project participants can review all files without needing

the native application. While participants will be able to view the files and mark comments, highlights and redline documents, the source file will not be affected. Redlining/commenting tools and support for 3D designs and large CAD drawings, give you the power to streamline collaboration, protect intellectual property, and store project information — from the initial concept through complete design and construction.

Document Archiving

If you're currently keeping your project documentation in filing cabinets in an office or warehouse, (depending on the number of capital development projects your firm is involved with) you will recognize the value of electronic archiving, an added benefit of working through Collaborator. If you are already trying to reduce these filing costs by scanning documents, take advantage of the e-Builder system doing this for you automatically. Searching for archived project documents can be a cumbersome task that can

take hours (or days). Collaborator eliminates this inefficiency through powerful built-in search capabilities to help you quickly retrieve a document or e-mail message. Contact us to learn more about our unlimited storage options.

Role Based Rights

Collaborator's user-friendly and simple interface lets each team member view only the information that is specific to them. System administrators use the role-based templates to quickly create new projects and give each team member the correct access to information. Best of all, e-Builder Collaborator is a hosted system that can be deployed rapidly and cost effectively thereby improving your return on investment.

e-Builder Collaborator is ideal for owners, architects & engineers, contractors, and suppliers and can be used on one or multiple projects in all phases of planning, construction and operations.

Collaborator features and Advantages

Fully Web-based system	Desktop software is not required and access is available worldwide via a browser and the Internet
Total administrative control	Create process templates, control access and permissions and set team member roles for the project
Configurable security	Define permissions to access, view and modify all information within the system
Document security, version control, and notifications	Get e-mail notifications of critical documents and to-do items. Provide easy access to the most current version and maintain all previous versions of draft documents; control access to view and modify information
Sophisticated routing system	Route documents (including photos) and requests according to your processes; track turnaround and response time and keep a complete historical log of the information
Routable and configurable forms	Large selection of forms (e.g. action items, approval forms, etc.) are tailored to your specific business processes
Publish information directly into e-Builder	Save time by publishing information directly into e-Builder using our print driver/file conversion tool
Limited public access to information	Automatic publishing of select information to a public Web site
Progress photo wizard	View and maintain a record of project progress with thumbnail photos
Automatic document conversion	Converts more than 250 file formats to pdf documents for easy viewing without having to purchase expensive software
Document viewing and red-lining	View, mark-up and distribute documents with multiple file formats in real-time without special software
Online interactive calendar	Schedule meetings and events with multiple contacts quickly
Inbound and outbound faxing capability	Communication into and out of the system via fax for members who don't have computer access
